

HEAR WHAT SITES ARE SAYING

Site user feedback is central to how we design and refine our products. This is what site professionals said when they reviewed Rater Station®.

SIMPLICITY AND EASE OF ACCESS

Sites have long managed a fragmented landscape of devices, logins, and portals. Rater Station's single access point and single-login, via any-device model immediately resonated with site users.

"I definitely think a lot of these changes will be very meaningful. The saving aspect will be great. The one login – because that's always incredibly confusing. I have a thousand different logins on different tablets."

STUDY COORDINATOR,
CNS site

"Browser-based access removes the 'find the tablet, charge it, update the app' friction that happens while a subject is on site."

DATA INTEGRITY AND RELIABILITY

Lost recordings, failed saves, and upload delays are operational risks for sites. Rater Station's cloud-based architecture and real-time transmission address these concerns directly.

"With Rater Station, data is transmitted in real time. That closes the gap where sites were randomizing patients before their screening data had even been uploaded from an offline device."

CLINICIAN WITH CNS SITE EXPERIENCE

"Hopefully the robust contingency plan will be a huge help for us. We've lost a lot of scales before – a huge number – and we didn't really plan for starting over an assessment in our timeline for the day."

FREEDOM FROM THE VENDOR TABLET

Sites juggle multiple vendor tablets, each tied to specific patients and studies without the ability to conduct concurrent assessments. Rater Station directly addresses this issue.

"It is so much easier when they can log in and work on a study from any device..."

Built on Site Feedback. Endorsed by Sites.

WHAT RATER STATION® DELIVERS

Single Access Point. One login. All studies.

Web-based and accessible from any browser-capable device, Rater Station gives sites a single access point with one login via ID Portal across all studies and all sponsors.

Data integrity throughout every assessment.

Sessions auto-save throughout each assessment, preventing data loss in the event of mid-rating hardware or connectivity issues. Audio and video recordings stream continuously to the cloud rather than saving locally, simplifying site workflow and reducing risk of loss.

Freedom from the vendor tablet.

Patient assessments are device independent. Concurrent assessments (e.g., patient and caregiver) can run across multiple exam rooms simultaneously, streamlining clinic time and reducing visit durations. If a device becomes unavailable mid-assessment, the session can resume where it left off by accessing any other available device.

When connectivity fails.

Even when connectivity is unavailable, a built-in paper fallback process maintains data collection continuity.

WHAT THIS MEANS FOR SPONSORS

Site efficiency and satisfaction are critical factors to study success. When site professionals carry a high overhead of technology management across studies, that competes with patient-facing time. Rater Station reduces that overhead directly. One access point, one login, real-time data transmission, and hardware-independent access mean site personnel spend less time managing technology and more time on what matters: patients and data quality.

“I think this solves everything I could really think of in terms of making it more efficient.”
